Abstract

Halemane($3X \pm 1$)/4System is defined, similar to the Collatz ($3x+1$) System, with slightly modified operations. On similar lines, we define the CTUHSK($3x+1$)/4System, and show that to be exactly the same as the Collatz ($3x+1$) System. The convergence of Halemane($3X \pm 1$)/4System to its trivial-cycle $\{(1 \Leftarrow (2) \Leftarrow 4)\}$ is established. A reversible (invertible) transformation - based on a judiciously designed pruning-&-joining operations on the system arborescence - between Halemane($3X \pm 1$)/4System and CTUHSK($3x+1$)/4System is shown not to affect the binary(inward)arborescence structure as well as the convergence characteristics of either of the systems. This establishes the convergence of the CTUHSK($3x+1$)/4System and therefore provides a definitive proof of the convergence of the Collatz-Thwaites-Ulam-Hasse-Syracuse-Kakutani (CTUHSK) Sequence; asserting the Collatz Conjecture.

This paper also presents Halemane-Conjecture associated with the Collatz sequence, that the upper bound on the number of odd $(3x+1)$ operations required to reach the trivial-cycle $\{(1 \Leftarrow 2 \Leftarrow 4)\}$ starting from any given positive integer and moving along the Collatz sequence, is the given number itself; the triad $\{(31 \Leftarrow 41 \Leftarrow 27)\}$ being an exceptional limiting case.

1. Introduction

The Collatz-Thwaites-Ulam-Hasse-Syracuse-Kakutani (CTUHSK) Conjecture, simply referred to as the *Collatz Conjecture* [§1] states that the Collatz $(3x+1)$ Sequence, also referred to as the Collatz Sequence, converges to the trivial-cycle, that is, $\{(1 \Leftarrow 2 \Leftarrow 4)\}$, starting from any positive integer.

Lagarias [§2]&[§3] gives an exhaustive annotated bibliography, whereas Lagarias [§4]&[§5] gives an elaborate overview of the Collatz Problem, also referred to as the

“ $3x+1$ problem”, referring to it as “The Ultimate Challenge”. Guy [§6] has been somewhat pessimistic in advising researchers “Don’t Try to Solve These Problems”. Lagarias [§4]&[§5] refers to the statement by the most revered Mathematician and Number Theory Expert Paul Erdos, who said that - “Mathematics is not yet ready for such problems” - about the Collatz Conjecture. The Collatz ($3x+1$) Sequence is indeed a highly complex chaotic system, although defined or generated with one of the simplest deterministic well-defined equations, that too, just two in number. We will not get into any more of the reported literature except the problem definition; but will simply focus on a rather shockingly simple approach toward a possible resolution of this amazingly notorious long-standing unresolved problem.

This paper presents Halemane’s $(3x±1)/4$ System that is defined on similar lines as the Collatz ($3x+1$) System with slightly modified operations. Also, on similar lines, we define the CTUHSK($3x+1$)/4System and show it to be exactly the same as the Collatz ($3x+1$) System. The Halemane($3X±1$)/4System is shown to converge to its trivial-cycle $\{(1↔4)\}$. We also present a meticulously designed reversible (invertible) transformation between Halemane($3X±1$)/4System and CTUHSK($3x+1$)/4System, which does not affect the binary(inward)arborescence structure as well as the convergence characteristics of either of the systems. This establishes the convergence of the Collatz Sequence and provides a definitive proof of Collatz Conjecture.

2. Halemane($3X±1$)/4System

Halemane($3X±1$)/4System H is defined on the set of positive integers, through its immediate-successor function $S(x) := H(x)$ as follows:

For any given positive integer $x > 1$;
 if & when $x=1$ stop; (trivial-cycle detected);
 elseIf $x \equiv 0 \pmod{4}$ then, $S(x) := H(x) := (x/4)$;
 elseIf $x \equiv 2 \pmod{4}$ then, $S(x) := H(x) := (x/2)$;
 elseIf $\{x \equiv 1 \pmod{4}\}$ then, $S(x) := H(x) := (3x+1)$;
 elseIf $\{x \equiv 3 \pmod{4}\}$ then, $S(x) := H(x) := (3x-1)$; [Eqn.1]

Table-1 gives the 4×4 state transition matrix $H(x,y)$ for Halemane(3X±1)/4System. Note that $[c]_b$ represents the modular (modulo-b) residue class c that a given number belongs to.

$H(x,y)$	$[0]_4$	$[2]_4$	$[1]_4$	$[3]_4$
$[0]_4$	0	1	1	1
$[2]_4$	0	0	1	1
$[1]_4$	1	0	0	0
$[3]_4$	1	0	0	0
Table-1: Halemane(3X±1)/4System				

Observe that as per the definition of Halemane(3X±1)/4System, for every positive integer x there is a single unique immediate-successor. Also note that as per the definition of Halemane(3X±1)/4System, for any given positive integer, there exists an *immediate-even-predecessor* that is a positive even number, as a default. Additionally, for any given positive even number $x \in \{[2]_6, [4]_6\}$ of the form $(12m \pm 4)$; there exists an *immediate-odd-predecessor* that is a positive odd number.

This characteristic property results in a binary(inward)arborescence structure with the trivial-cycle $\{(1 \Leftarrow (2) \Leftarrow 4)\}$ as a root and every odd multiple of 3 being an odd-leaf node with all its predecessors being only positive even numbers.

Table-2 gives the expanded 12x12 state transition matrix $H(x,y)$ for Halemane(3X±1)/4System, that explicitly captures and represents the above-mentioned characteristic property.

$H(x,y)$	$[0]_{12}$	$[4]_{12}$	$[8]_{12}$	$[2]_{12}$	$[6]_{12}$	$[10]_{12}$	$[1]_{12}$	$[5]_{12}$	$[9]_{12}$	$[3]_{12}$	$[7]_{12}$	$[11]_{12}$
$[0]_{12}$	0	0	0	1	1	1	1	1	1	1	1	1
$[4]_{12}$	0	0	0	1	1	1	1	1	1	1	1	1
$[8]_{12}$	0	0	0	1	1	1	1	1	1	1	1	1
$[2]_{12}$	0	0	0	0	0	0	1	1	1	1	1	1
$[6]_{12}$	0	0	0	0	0	0	1	1	1	1	1	1
$[10]_{12}$	0	0	0	0	0	0	1	1	1	1	1	1
$[1]_{12}$	0	1	0	0	0	0	0	0	0	0	0	0
$[5]_{12}$	0	1	0	0	0	0	0	0	0	0	0	0
$[9]_{12}$	0	1	0	0	0	0	0	0	0	0	0	0
$[3]_{12}$	0	0	1	0	0	0	0	0	0	0	0	0
$[7]_{12}$	0	0	1	0	0	0	0	0	0	0	0	0
$[11]_{12}$	0	0	1	0	0	0	0	0	0	0	0	0
Table-2: Halemane(3X±1)/4System - 12x12 State Transition Matrix												

Also note that a positive even number $x \in \{[0]_{12}\} \vee \{[2]_{12}\} \vee \{[6]_{12}\} \vee \{[10]_{12}\}$ cannot have any *immediate-odd-predecessor*, and such nodes are called inactive-nodes in the system.

3. Convergence of Halemane(3X±1)/4System

Note that every application of the $(3.x\pm 1)$ operation produces an immediate resultant positive even numbers $x \in \{[0]_4\}$; and therefore every $(3.x\pm 1)$ operation *must necessarily be followed by at least one* application of the $(x/4)$ operation; and may even be followed by further repetitions of it; leading to an *immediate decrease* in the numerical value of the operand. Therefore, the resulting odd-to-odd sequence is a “*monotonically strictly decreasing odd-to-odd sequence*” – a characteristic property that we refer to as, a persistent local ‘odd-to-odd monotonicity’. This immediately establishes the convergence of Halemane(3X±1)/4System to its trivial-cycle $\{(1 \Leftarrow (2) \Leftarrow 4)\}$; starting with any positive integer. This convergence property implies that the system arborescence, representing the transitive-closure of the subset $\{1,5,3\}$; that is, $[\{1,5,3\}H+]$; under the inverse mapping of Halemane(3X±1)/4System; indeed covers the entire set of positive integers.

4. Collatz $(3x+1)$ System re-written as CTUHSK(3x+1)/4System

The Collatz(3x+1)/2System can be defined by its immediate-successor function $S(x)$ for the (classical/canonical) Collatz $(3x+1)$ system that can be written as –

For any given positive integer $x > 1$;
 if & when $x=1$ stop; (trivial-cycle detected);
 elseif $x \equiv 0 \pmod{2}$ then, $S(x) := (x/2)$;
 elseif $\{x \equiv 1 \pmod{2}\}$ then, $S(x) := (3x+1)$; [Eqn.2]

Observe that as per [Eqn.2]; for every positive integer x there exists a single unique immediate-successor.

Also note that the immediate-successor of any positive odd number of the form $(4m+1)$ in the Collatz sequence is a positive even number of the form $(12m+4)$; that is, a number $x \in \{[0]_4\}$ that is always divisible by 4 *at least once*, and therefore the combined operation can be denoted by a single $((3x+1)/4)$ operation; which leads to a clear decrease in the numerical value for the resultant odd number.

5. Critical-Issue, Critical-(Decision)-Node, Detour-Link, Detour-Node

The immediate-successor of any positive odd number of the form $(4m-1)$ in the Collatz sequence is a positive even number of the form $(12m-2)$; that is, a number $x \in \{[2]_4\}$ that is always divisible by 2 *exactly once* only. The combined operation can be denoted by a single $((3x+1)/2)$ operation, with its immediate resultant being a positive odd number of the form $(6m-1)$; with an increase in the numerical value of the operand. We designate this specific step $\{(12m-2) \Leftarrow (4m-1)\}$ in the Collatz sequence as a critical *detour-link*; because it is indeed the very source for the possible ambiguity (*critical-issue*) regarding the convergence of the Collatz sequence. The initial-node $(4m-1)$ of a detour-link is its *critical-(decision)-node*; and its terminal-node $(12m-2)$ is a *detour-node*. This *critical-issue* will be addressed appropriately in this paper.

As a first step, the Collatz $(3x+1)$ system originally defined by [Eqn.2] can now be re-written as an equivalent CTUHSK(3x+1)/4System; with a special single application of a $(x/2)$ operation in such specific cases whenever the operand is a

positive even number of the form $(12m-2)$ arising as the immediate resultant of the application of the $(3x+1)$ operation on a positive odd number of the form $(4m-1)$.

[Eqn.3] gives this redefined version C, renamed as the CTUHSK(3x+1)/4System.

Start with any given positive integer $x > 1$;

if & when $x=1$ stop; else continue;

elseIf $x \equiv 0 \pmod{4}$ then, $S(x) := C(x) := (x/4)$;

elseIf $x \equiv 2 \pmod{4}$ then, $S(x) := C(x) := (x/2)$;

elseIf $\{(x \equiv 1 \pmod{4}) \vee ((x \equiv 3 \pmod{4}))\}$ then, $S(x) := C(x) := (3x+1)$; [Eqn.3]

Table-3 gives the 4x4 state transition matrix $C(x,y)$ for CTUHSK(3x+1)/4System.

$C(x,y)$	$[0]_4$	$[2]_4$	$[1]_4$	$[3]_4$
$[0]_4$	0	1	1	1
$[2]_4$	0	0	1	1
$[1]_4$	1	0	0	0
$[3]_4$	0	1	0	0
Table-3: CTUHSK(3x+1)/4System				

Observe that as per the definition of Collatz $(3x+1)$ System or its exact equivalent, the CTUHSK(3x+1)/4System, for every positive integer x there is a single unique immediate-even-predecessor, as a default. Additionally, for any given positive even number $x \in \{[4]_{12}\} \vee \{[10]_{12}\}$ of the form $\{(12m+4) \vee (12m-2)\}$ there exists an *immediate-odd-predecessor* that is a positive odd number. This characteristic

property results in a binary(inward)arborescence structure with its trivial-cycle $\{(1 \Leftarrow 2 \Leftarrow 4)\}$ as a root and every odd multiple of 3 being an odd-leaf node. The system arborescence represents the transitive-closure of the subset $\{1,5,3\}$; that is, $\{1,5,3\}C^+\}$; under the inverse mapping of CTUHSK(3x+1)/4System. We will show that this is exactly the same as $\{1,5,3\}H^+\}$ which covers the entire set of positive integers.

Table-4 gives the expanded 12x12 state transition matrix $C(x,y)$ for CTUHSK(3x+1)/4System, that explicitly captures and represents the above-mentioned characteristic property.

$C(x,y)$	$[0]_{12}$	$[4]_{12}$	$[8]_{12}$	$[2]_{12}$	$[6]_{12}$	$[10]_{12}$	$[1]_{12}$	$[5]_{12}$	$[9]_{12}$	$[3]_{12}$	$[7]_{12}$	$[11]_{12}$
$[0]_{12}$	0	0	0	1	1	1	1	1	1	1	1	1
$[4]_{12}$	0	0	0	1	1	1	1	1	1	1	1	1
$[8]_{12}$	0	0	0	1	1	1	1	1	1	1	1	1
$[2]_{12}$	0	0	0	0	0	0	1	1	1	1	1	1
$[6]_{12}$	0	0	0	0	0	0	1	1	1	1	1	1
$[10]_{12}$	0	0	0	0	0	0	1	1	1	1	1	1
$[1]_{12}$	0	1	0	0	0	0	0	0	0	0	0	0
$[5]_{12}$	0	1	0	0	0	0	0	0	0	0	0	0
$[9]_{12}$	0	1	0	0	0	0	0	0	0	0	0	0
$[3]_{12}$	0	0	0	0	0	1	0	0	0	0	0	0
$[7]_{12}$	0	0	0	0	0	1	0	0	0	0	0	0
$[11]_{12}$	0	0	0	0	0	1	0	0	0	0	0	0
Table-4: CTUHSK(3x+1)/4System 12x12 State Transition Matrix												

Also note that a positive even number $x \in \{[0]_{12}\} \vee \{[2]_{12}\} \vee \{[6]_{12}\} \vee \{[8]_{12}\}$ cannot have any *immediate-odd-predecessor*, and such nodes are called inactive-nodes in the system.

Note that the highlighted entries in Table-3 and Table-4 indicate the differences in comparison with the corresponding entries in Halemane(3X±1)/4System presented in Table-1 and Table-2.

6. CTUHSK(3x+1)/4System compared with Halemane(3X±1)/4System

First, observe that the difference between Halemane(3X±1)/4System and CTUHSK(3x+1)/4System; as highlighted in the tabular representation of the system state transitions; corresponds to only the critical-(decision)-node (4m-1). The critical-(decision)-node (4m-1) is linked to the detour-node (12m-2) through the detour-link $\{(12m-2) \Leftarrow (4m-1)\}$ in CTUHSK(3x+1)/4System. However, in Halemane(3X±1)/4System, the critical-(decision)-node (4m-1) is linked to a positive even number of the form (12m-4) through a link $\{(12m-4) \Leftarrow (4m-1)\}$. We designate the link $\{(12m-4) \Leftarrow (4m-1)\}$ that is present in Halemane(3X±1)/4System as the *shortcut-link* and its terminal-node (12m-4) as the *shortcut-node*.

7. From Halemane(3X±1)/4System to the CTUHSK(3x+1)/4System

Perform the following **pruning-&-joining operation** on the Halemane(3X±1)/4System, recursively/iteratively, to transform it into the CTUHSK(3x+1)/4System.

- (1) **PRUNING OPERATION:** Disconnect the critical-decision-node $(4m-1)$ from the shortcut-node $(12m-4)$; by pruning the shortcut-link $\{(12m-4) \Leftarrow (4m-1)\}$ in Halemane(3X±1)/4System arborescence H . This pruning operation yields a free-hanging subtree, with the critical-decision-node $(4m-1)$ as its root; denoted by $(4m-1)H_+ \subseteq H$; corresponding to a branch of the original arborescence H .
- (2) **JOINING OPERATION:** Connect this critical-decision-node $(4m-1)$ onto the detour-node $(12m-2)$; which is known to be an otherwise inactive-node in Halemane(3X±1)/4System; by a joining operation; through a newly created detour-link $\{(12m-2) \Leftarrow (4m-1)\}$. Note that the detour-node $(12m-2)$ is intended to act as an even-predecessor of an odd node $(6m-1)$ in the prospective CTUHSK(3x+1)/4System C being generated.

Thus, the entire subtree $(4m-1)H_+ \subseteq H$ that was pruned in pruning operation, now get joined to the detour-node $(12m-2) \in (6m-1)T_+$ as a new branch; where T is an intermediate transition-system-subtree; meant to be belonging to system C along with the remaining links of system H . That is, the subtree $(6m-1)T_+$ captures the entire pruned subtree $(4m-1)H_+ \subseteq H$ merely as an additional branch.

The above-described pruning-&-joining operation can be performed iteratively; that is, by replacing every link of the form $\{(12m-4) \Leftarrow (4m-1)\}$ with a link of the form $\{(12m-2) \Leftarrow (4m-1)\}$; for $m \in \{1, 2, 3, \text{etc.}\}$; without necessarily considering any network-based recursive algorithm to process on the subtrees etc.; although a network-based algorithm may facilitate in a better conceptual understanding of the process involved in the pruning-&-joining operations therein.

8. From the CTUHSK(3x+1)/4System to Halemane(3X±1)/4System

A similar pruning-&-joining process can be described to transform CTUHSK(3x+1)/4System to Halemane(3X±1)/4System, that is, by replacing every detour-link of the form $\{(12m-2) \Leftarrow (4m-1)\}$ by the corresponding newly created shortcut-link of the form $\{(12m-4) \Leftarrow (4m-1)\}$; as described below:

- (a) **PRUNING OPERATION:** Disconnect the critical-decision-node $(4m-1)$ from the detour-node $(12m-2)$; by pruning the shortcut-link $\{(12m-2) \Leftarrow (4m-1)\}$ in CTUHSK(3x+1)/4System arborescence C. This pruning operation yields a free-hanging subtree, with the critical-decision-node $(4m-1)$ as its root; denoted by $(4m-1)C_+ \subseteq C$; corresponding to a branch of the original arborescence C.
- (b) **JOINING OPERATION:** Connect this critical-decision-node $(4m-1)$ onto the shortcut-node $(12m-4)$; which is known to be an otherwise inactive-node in CTUHSK(3x+1)/4System; by a joining operation; through a newly created detour-link $\{(12m-4) \Leftarrow (4m-1)\}$. Note that the detour-node $(12m-4)$ is intended to act as an even-predecessor of an odd node $(3m-1)$ in the prospective Halemane(3X±1)/4System H being generated.

Thus, the entire subtree $(4m-1)C_+ \subseteq C$ that was pruned in pruning operation, now get joined to the shortcut-node $(12m-4) \in (3m-1)T_+$ as a new branch; where T is an intermediate transition-system-subtree; meant to be belonging to system H along with the remaining links of system C. That is, the subtree $(3m-1)T_+$ captures the entire pruned subtree $(4m-1)C_+ \subseteq C$ merely as an additional branch.

The above-described pruning-&-joining operation can be performed iteratively; that is, by replacing every link of the form $\{(12m-2) \Leftarrow (4m-1)\}$ with a link of the form

$\{(12m-4) \Leftarrow (4m-1)\}$; for $m \in \{1, 2, 3, \text{etc.}\}$; without necessarily considering any network-based recursive algorithm to process on the subtrees etc.; although a network-based algorithm may facilitate in a better conceptual understanding of the process involved in the pruning-&-joining operations therein.

9. Proof of the Collatz Conjecture

We have already established the convergence of Halemane(3X±1)/4System to its trivial-cycle $\{(1 \Leftarrow (2) \Leftarrow 4)\}$; and that the system structure is a binary(inward)arborescence with this trivial-cycle as the root and every odd multiple of 3 being an odd-leaf node. The CTUHSK(3x+1)/4System is shown to be exactly identical to the Collatz (3x+1) System. Also, the above-described pruning-&-joining process provides a transformation mechanism between Halemane(3X±1)/4System and CTUHSK(3x+1)/4System.

Observe that neither the binary(inward)arborescence structure nor the convergence characteristics of - (1) either Halemane(3X±1)/4System H (2) or the CTUHSK(3x+1)/4System C (3) or any of the intermediate transition system T - get affected by the above-described pruning-&-joining process. This is because at every iteration, the pruned subtree is joined onto an already existing and otherwise hitherto inactive-node of the existing system, or rather the intermediate transition system. Therefore, the transitive-closure of the subset $\{1,5,3\}$; that is, $[\{1,5,3\}C+]$; under the inverse mapping of CTUHSK(3x+1)/4System; is exactly the same as the transitive-closure of the subset $\{1,5,3\}$; that is, $[\{1,5,3\}H+]$; under the inverse mapping of Halemane(3X±1)/4System; which is already shown to cover the entire set of positive integers. That is, the convergence of Halemane(3X±1)/4System to

its trivial-cycle $\{(1 \Leftarrow (2) \Leftarrow 4)\}$ in turn proves the convergence of CTUHSK(3x+1)/4System to its trivial-cycle $\{(1 \Leftarrow 2 \Leftarrow 4)\}$.

Also, note that, every pruning-&-joining operation can be considered to be analogous to shifting from a shortcut sub-route to a detour sub-route or from a detour sub-route to a shortcut sub-route; that shifting decision itself being taken at every critical-(decision)-node.

10. Summary

Halemane(3X±1)/4System has been defined, similar to the Collatz (3x+1) System; with slightly modified operations. We have also defined the CTUHSK(3x+1)/4System, and shown that to be exactly the same as the Collatz (3x+1) System. The global convergence of Halemane(3X±1)/4System to its trivial-cycle $\{(1 \Leftarrow (2) \Leftarrow 4)\}$ is established through the local ‘odd-to-odd monotonicity’ property of the defining function. A reversible (invertible) transformation between Halemane(3X±1)/4System and CTUHSK(3x+1)/4System has been designed, based on a process consisting of pruning-&-joining operations performed recursively/iteratively on the binary(inward)arborescence structure of the system. This pruning-&-joining operation does not affect the binary(inward)arborescence structure as well as the convergence characteristics of either of the systems, because the pruned subtree is joined onto an already existing inactive-node of the system arborescence. Therefore, this establishes the convergence of the Collatz-Thwaites-Ulam-Hasse-Syracuse-Kakutani (CTUHSK) Sequence and providing a definitive proof of Collatz Conjecture.

Halemane-Conjecture on the Collatz $(3x+1)$ sequence states that the maximum limit on number of odd $(3x+1)$ operations required to reach the trivial-cycle $\{(1 \Leftarrow 2 \Leftarrow 4)\}$; starting from any given positive integer and moving along the Collatz sequence; is the given number itself; with the triad $\{(31 \Leftarrow 41 \Leftarrow 27)\}$ as an exceptional limiting case.

12. Acknowledgement & Confession & Assertion

I must necessarily confess/acknowledge that the *core idea behind this proof of the Collatz Conjecture is so stunningly and elusively simple*, that one may simply be taken aback in a profound wonder-struck jaw-drop-silence, possibly with an after-thought: "OMG, *how could it be that it never flashed on me any time earlier*"!

However, I assert that “क्लिष्टविशयसरलीकरणमेव पाण्डित्यलक्षणम् | न तु सरलविषयसंक्लिष्टीकरणम्” || That is, “*to make the complex simple is a mark of mastery; not to make the simple complex*”.
